

Employee Attendance Tracking Task

Overview

- An office uses a biometric system to track attendance for their employees
- The system does not provide an individual dashboard for each employee to see their attendance
- Nor do it provide a team wise dashboard where a manager can review the attendance of his/her team members
- We can export a xls file from the software - a sample is provided
- They do provide an API where user attendance data can be retrieved
- API documentation is provided

Software Solution

- Design and implement a solution that will allow each individual team member to view their attendance in a secure manner
- Each manager should be able to see their own attendance and the attendance of their reporting team members. It should follow the hierarchy e.g. If a reporting team member is a manager then the manager should be able to see attendance of the sub-team members also

Task

- Implement the solution that meets the above requirements
- Use any technology stack - explain the reason you choose a particular stack
- Use AI as needed - share all the chats with the AI
- Make assumptions where needed
- Describe your approach in a short document
- Be ready to discuss alternatives - e.g. If the API is not available what can be a semi-automated approach?
